- influenzayesno
- pneumococcal vaccineyesno

Female of childbearing age susceptible to CMV or parvovirus?yesno

Evaluation of tuberculosis status shows a risk for communicable TB?yesno

Mantoux test date _____ Result _____

(Tuberculosis status must be determined by performing the Mantoux test (intradermal, intermediate strength PPD injection with needle and syringe) for persons not previously tested positive for tuberculosis infection. For individuals over 55 years of age, anyone with pulmonary symptoms, or immune deficiency, the Mantoux test should be performed twice if the first test is negative. The second test should be performed 1-3 weeks after the first test. Anyone with a previously positive Mantoux test who has symptoms suggestive of active TB should have a chest x-ray. All newly positive Mantoux tests should be followed by x-ray evaluation.)

Please attach additional sheets to explain all "yes" answers above. Include the plan for follow up.
